

# PSB-S

## Resilient Partition Attachment

For use when wall isolation is desired for wood-and steel-frame studwall construction, PSB-S supports the partition from buckling and eliminates the “give” felt when leaning on a wall that is acoustically isolated. PSB-S can be implemented in many construction situations, as it is a multi-axis restraint and is seismically rated.

Decoupling a partition from non-isolated structural components, while maintaining structural integrity, is crucial to the success of any isolation construction. PSB-S should be used when a partition isn’t supported at the top plate or when support at the top and bottom of the partition isn’t sufficient to keep the partition from buckling.

- 11-ga galvanized steel bracket
- Adjustable standoff can be tailored to specific airspaces (2-1/2" minimum)
- Static load rating of 50 lbs.
- 7/16" thru slots for easy installation
